                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -!- SUBUNIT: Heterodimer of an alpha chain and a beta chain (beta-2-microglobulin).
-!- SUBCELIULAR LOCATION: Type I membrane protein.
-!- POLYMORPHISM: The following alleles of B-47 are known: B*4701,
B*4702 and B*4703. The sequence shown is that of B*4701.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CLASS I HISTOCOMPATIBILITY ANTIGEN,

GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: Cancer Cell-Specific HLA-F Antigen and a Diagnostic Method of Cartille OF INVENTION: Using Thereof
TITLE OF INVENTION: Using Thereof
TITLE OF INVENTION: US/09/819,371
CURRENT APPLICATION NUMBER: US/09/819,371
CURRENT FILING DATE: 2002-03-15
NUMBER OF SEQ ID NOS: 6
SOUTWARE: Patentin version 3.0
SEQ ID NO 5

This invention relates to a cancer cell specific HLA-F antigen. The invention includes DNA encoding the antigen, and a method for the preparation of the cancer cell specific HLA-F antigen. The antigen may be used in a method to diagnose cancer, in which the protein is used to detect anti-HLA-F antibodies in bodily fluids of the patient. The present sequence represents the cancer cell-specific HLA-F antigen of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a cancer cell specific HLA-F antigen. The invention includes DNA encoding the antigen, and a method for the preparation of the cancer cell specific HLA-F antigen. The antigen may be used in a method to diagnose cancer, in which the protein is used to detect anti-HLA-F antibodies in bodily fluids of the patient. The present sequence represents the cancer cell-specific HLA-F antigen of the

The invention relates to methods for diagnosing and prognosing ovarian tumours in an individual via the detection and measurement of the expression of ovarian tumour marker genes (ARA831812, ARA83180, ARA831812 and ARA83184) or segments thereof (ARA83123-ARA83189, ARA83181 and ARA83183). The methods of the invention are useful for detecting an ovarian tumour in a patient, for identifying an individual at increased risk for developing ovarian cancer, in prognostic tests for assessing the relative severity of ovarian cancer, in tests for monitoring a patient in remission from ovarian cancer and in tests for monitoring disease status in a patient being treated for ovarian cancer. The methods can additionally be used to identify a particular tumour as being an ovarian tumour (1.e., an epithelial ovarian tumour selected from serous cystadenoma, borderline serous tumour, serous cystadenoma,
                                                                                                                                                                                                                                        Detecting and identifying ovarian tumor, identifying increased risk for developing ovarian cancer, and determining effectiveness of ovarian cancer treatment, by measuring expression level of ovarian tumor marker

mucinous cystadenoma, borderline mucinous tumour, mucinous cystadenocarcinoma, endometrioid carcinoma, undifferentiated carcinoma, clear cell adenocarcinoma, cystadenofibroma, adenofibroma and Brenner tumour. The ovarian tumour marker genes of the invention were identified using SAGE (serial analysis of gene expression) and were found to be overexpressed in a broad variety of ovarian epithelial tumour cells relative to normal ovarian epithelial cells. The marker genes are implicated in immune response pathways, in the regulation of cell proliferation and in protein folding, and many of these are membranelocalised or secreted. In addition to their use as diagnostic and

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGN) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cutivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in issue, as molecular weight markers and as a food pupplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of layobypeptide and polymucleotide sequences have applications in diagnostics, foremsics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and and can to produce other types of data and products dependent on DNA and anno acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from MIPO at the privations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180

                                                                                                                                                                                                                                                                                                                                                                            AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidateric; caequlant; noctropic; vasotropic; antipsoriatic and antiangiogenic. The polymucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polymucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune cills, to treat disorders of haematopoietic cells, autoimmune rejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease and agonists and antagonists may be also be used in drug screens. AAC7849 to AAC78457 and AAB44240 represent sequences used in the exemplification of

This invention relates to a cancer cell specific HLA-F antigen. The invention includes DNA encoding the antigen, and a method for the used used in a method to diagnose cancer, in which the protein is used to detect anti-HLA-F antibodies in bodily fluids of the patient. The present sequence represents the cancer cell-specific HLA-F antigen of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ద
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dr primed cDNA libraries. Such ESTs are not well suited for isolating cDNA primed cDNA libraries. Such ESTs are not well suited for isolating cDNA included. S' ESTs are derived from mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cONAs and genomic DNAs. S' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABG54131-ABG56305), and also encompasses polypeptides 90% identical and polymucleotides 95% identical comprising human ovarian antigens to the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens to polymucleotides, antibodies against human ovarian antigens and the use of ovarian antigens polymucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast cancer, and disorders. Such conditions include ovarian cancer and breast cancer, and disorders (e.g., infertility, disorders origin, reproductive system disorders (e.g., infertility, disorders origin, reproductive system disorders (e.g., chlamydia, HIV, toxoplammensia, endocrine clasorders, infertility, disorders, e.g., mastitis, oophoritis and varian cysts, and dysmenorrhoea), inflammatory conditions (e.g., mastitis, oophoritis and variantis), immune disorders (e.g., congenital and acquired to toxic shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and variantis), immune disorders (e.g., congenital and acquired to the sorders (e.g., anaemia), cardiovascular disorders (e.g., anaemia), cardiovascular disorders and usinary system disorders. Ovarian antigen polypeptides and disorders. Ovarian antigen polypeptides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polymucleotides may be used as food additives or to prepare antibodies (e.g., useful in disease diagnosis, drug targeting and phenotyping. The present sequence enter a human ovarian antigen part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed or the printed or the printed or the printed procession and the sequence data for this patent did netering to the printed processi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               66 YAKANAQTDRVALRNILRRYNQSEAGSHTLQGMNGCDMGPDGRLLRGYHQHAYDGKDYIS 125

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polymucleotide sequences AAF17982 - AAF18424 encode human lung cancer associated proteins represented in AAB58106 - AAB5848. Lung cancer associated proteins and polymucleotide sequences, their agonists, and antegonists may have neuroprotective; cytostatic; cardioactive; and catagonists may have neuroprotective; cytostatic; cardioactive; and golymucleotide sequences, their agreeological; or antibacterial cativity. The invention also includes antibodies specific for the protein or polymucleotide sequences. The lung cancer associated polymucleotide cor polymucleotide sequences. The lung cancer associated polymucleotide cor polymucleotide sequences. The protein or numerous other diagnostic or research purposes. The proteins may be used to treat disorders such as cardiovascular, renal, and proliferative disorders. The proteins may also be used in the treatment of wounds and infectious diseases.

Sequences and proliferative disorders. The proteins may also be used in the course of the invention for the identification and characterisation of the polymucleotide and protein sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

The concensus sequence is derived from a total of 23 HLA-A,B,C sequences. The protein sequences in the three extrecellular domains (alpha-1, alpha-2 and alpha-3) are shown. The example concerned the effect of peptides from different HLA-A2 epitopes on cytolysis of target cells by CTL of different specificities. (Updated on 25-MAR-2003 to correct FF field.) (Updated on 25-MAR-2003 to correct PF field.)

- isolated the

polypeptides products for

```
The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a mucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer.
                                      New isolated cancer associated nucleic acids and using sera from cancer patients, used to develop diagnosis, monitoring or treatment of cancers.
                                                                                                 Disclosure; Page 417-418; 787pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAO13073 standard; protein; 374 AA

The invention relates to human polynucleotides (AAI79941-AAI99841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodilatory activity and activity, and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent aid not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells for use in treatment of a pathology related to aberrant expression physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell
Claim 20; Page 683-684; 765pp; English.

"Hid-E, F., and G polymorphism: genomic sequence defines new variation
repanning the nonclassical class I genes.";

Submitted (JUN-2002) to the EMBL/GenBank/DDBJ databases.

-!-FUNCTION: INVOLVED IN THE PRESENTATION OF POREIGN ANTIGENS TO THE
INMUNE SYSTEM (BY SIMILARITY).

-!- SUBUNIT: DIMER OF ALPHA CHAIN AND A BETA CHAIN (BETA-2-

MICROGOBOLOLIN) (BY SIMILARITY).

Vicario J.L.;
"Complete cDNA coding sequence of a new HLA-A3 subtype (A*0304) with a
new HLA polymorphism at exon 3.";
Immunogenetics 49:360-361(1999).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  microglobulin).
SUBCELLULAR LOCATION: Type I membrane protein.
POLYMORPHISM: The following alleles of A-3 are known: A*0301
(A-3.1), A*0302, A*0304 and A*0305. The sequence shown is that of A*0301.
                                                      SEQUENCE FROM N.A. (A*0301).

Tissue Antigens 50:192-196(1997).

-!- FUNCTION: Involved in the presentation of foreign antigens to the immune system.

-!- FUNCTION: Involved in the presentation of foreign antigens to committee and a part of an alpha chain and a beta chain (beta-2-microglobulin).

-!- SUBGNIT: Heterodimer of an alpha chain and a beta chain (beta-2-microglobulin).

-!- FOLYMORPHISM: The following alleles of A-24 are known: A*2401, A*2402, A*2402, A*2403, A*2406, A*2408, A*2401, A*2413 are found in major racial groups. Allele A*2406 and allele A*2413 are found in the Australian Aborigenal population. Allele A*2414 is found in the Australian Aborigenal population. Allele A*2414 is found in the Australian Aborigenal population. Allele A*2414 is found in the Australian Aborigenal population. Allele A*2414 is found in the Australian Aborigenal population. Allele A*2414 is found in the Australian Aborigenal and descent. The sequence shown is that
